PARÔPHYROXIÂ

(HEWLETT'S)

It possesses three distinctive therapeutic powers—*i.e.*, Antiseptic, Purgative and Carminative—and is indicated in all cases of Colitis caused by undigested food, or irritative affections of the alimentary canal, partly no doubt by removing acrid irritating secretions or foreign materials, neutralising gaseous fluids, depleting the congested blood vessels, and arresting the distended and tympanitic condition of the colon, rendering it the safest and most satisfactory purgative in these cases. It is peculiarly adapted for those cases of Colic so frequently met with in aged horses, who are generally described as "Gross Feeders," where the food is bolted and not sufficiently masticated owing to the teeth being faulty, and where the digestive organs are impaired from a loss of tone in the system, the circulation bad, and the necessary amount of gastric juice is insufficient to digest the food. It is very extensively used in Scotland by numerous practitioners for the Colic caused by coarse feeding which produces impaction with painful contraction of the muscular coat of the bowels accompanied with tympanites.

It is in these cases that Parôphyroxiâ has a very marked effect in reducing the spasm, arresting fermentation, and subduing the drum-like condition of the colon. The large amount of clinical evidence adduced in its favour by various experienced and sound practitioners commends it so strongly that it is now placed at the head of the list of the different agents employed in the general treatment of Colic.

It should be well borne in mind that as the drug is purgative in its action no physic ball or other purgatives should be administered, but if the practitioner deemed it necessary to follow up the treatment with another draught, some simple antispasmodic would not be contra-indicated.
